Q1**B**

- B. Attempts to roast green chiles using 50 heliostats yields results in fewer than six minutes.

Choice B is the best answer. Armijo believes that using more heliostats will speed up the roasting process, and this finding shows that with 50 heliostats—more than the number of heliostats already used—the roasting time is indeed reduced.

Choice A is incorrect. The evenness of temperature in the roasting drum doesn't tell us about the speed of the roasting process, which is what Armijo's hypothesis is concerned with. Choice C is incorrect. Armijo's hypothesis is focused on the speed of the roasting process, not the flavor of the resulting roasted chiles. Choice D is incorrect. Though Armijo's hypothesis mentions a benefit of solar-roasting green chiles (easier peeling), it doesn't address the speed of the roasting process.

Q2**D**

- D. "We shall never know defeat."

Choice D is the best answer because it most effectively illustrates the claim that the speaker in the poem "We Are Marching" predicts future success. To say that someone will "never know" an experience—like defeat, or being unsuccessful—is to indicate that they will never personally have that experience. Thus, when the speaker says that the marching group "shall never know defeat," the speaker is predicting that the group will experience only success in the future.

Choice A is incorrect because the quotation presents a question about an activity already taking place (marching), not a statement about future success. The speaker is asking if the sound of marching feet is being heard. Choice B is incorrect because the quotation directs an immediate action instead of making a prediction about the future. The speaker is telling people to "get in line," or to join the march that's already happening. Choice C is incorrect because the quotation describes a past action instead of making a prediction about the future. The speaker is stating that those in the march have "answered duty's call"—that is, that they have acted out of a sense of duty.

Q3

A

- A. The newspaper published approximately 1,000 investigative articles in 2010 and approximately 500 in 2019.
-

Choice A is the best answer. By comparing the number of investigative articles in 2010 to the number in 2019, we can see that the number has fallen overall.

Choice B is incorrect. This choice misreads the graph. The 1,600 articles published in 2013 was the largest annual number of investigative articles published during the period. Also, notice that the claim focuses on an overall change, while this choice just focuses on one year. We can't determine an overall increase or decrease by looking at just one year. Choice C is incorrect. The 1,000 articles published in 2017 wasn't the largest number published during the period. Also, notice that the claim focuses on an overall change, while this choice just focuses on one year. We can't determine an overall increase or decrease by looking at just one year. Choice D is incorrect. This choice doesn't justify the claim. The claim is about a decrease in articles published between 2010 and 2019. This data shows an increase in articles published over a different period (2010-2013).

Q4

C

- C. but participant 20 reported feeling significantly colder than the other two participants did.
-

Choice C is the best answer. The text describes the comfort rating scale: from -3 (very cold) to $+3$ (very hot), with 0 being neutral. Participant 20 gave a -2 comfort rating, a full three points colder on the scale than the other two participants.

Choice A is incorrect. This choice misreads the table. Participant 1 and participant 21 reported the same level of comfort, but participant 20's comfort level was three points lower. Choice B is incorrect. This choice doesn't use data from the table. The table only shows us one survey, so we don't know if the participants' ratings varied throughout the day. Choice D is incorrect. This choice misreads the table. Participant 1 and participant 21 reported the same level of comfort.

Q5

C

C. 500 to 2,000 meters below the surface

Choice C is the best answer. The table shows the depths below the ocean surface at which four species of deep-sea fish live. According to the table, the range of depths at which the southern stoplight loosejaw lives is 500–2,000 meters below the surface.

Choice A is incorrect because the table indicates that the southern stoplight loosejaw lives 500–2,000 meters below the ocean surface, not at depths more than 2,000 meters below the surface. Choice B is incorrect because the table indicates that the southern stoplight loosejaw lives 500–2,000 meters below the ocean surface, not 150–400 meters below the surface. Choice D is incorrect because the table indicates that the southern stoplight loosejaw lives 500–2,000 meters below the ocean surface, not 250–500 meters below the surface.

Q6

C

C. 0.75.

Choice C is the best answer because it effectively uses data from the table to complete the example of the estimated impact of invasive mongooses on threatened mammals. The table shows the values for the estimated harmful impact of three invasive predator species (mongooses, dogs, and cats) on threatened birds, mammals, and reptiles. The text states that the values are on a scale from 0.25 (less impact) to 1.00 (greater impact). The table shows that the value for the estimated impact of invasive mongooses on threatened mammals is 0.75.

Choice A is incorrect because the table shows that the value for the estimated impact of mongooses on threatened mammals is 0.75, not 0.35. The value 0.35 is not assigned to any of the categories in the table. Choice B is incorrect because the table shows that 0.61 is the value for the estimated impact of cats, not mongooses, on threatened mammals. Choice D is incorrect because the table shows that 0.52 is the value for the estimated impact of cats on threatened reptiles, not of mongooses on threatened mammals.

Notes

Accept equivalent forms (e.g. $0.25 \equiv 1/4$). For grid-in items, decimal and fraction answers are both valid.
