10 answers · Rationale-rich · Teach from doc

**Q1****C**

**C.** 8 percent of survey participants in Japan.

Choice C is the best answer because it most effectively uses data from the table to complete the text about survey results for online account sign-in methods. According to the table, 8 percent of participants in Japan viewed onetime passcodes as the most secure sign-in method. This is the only choice that correctly represents data in the table.

Choice A is incorrect because according to the table, 33 percent of participants in the UK viewed biometrics, not onetime passcodes, as the most secure sign-in method; onetime passcodes were viewed as the most secure method by 16 percent of these participants. Choice B is incorrect because according to the table, 22 percent of participants in India viewed biometrics, not onetime passcodes, as the most secure sign-in method; onetime passcodes were viewed as the most secure method by 25 percent of these participants. Choice D is incorrect because according to the table, the country in which 16 percent of participants viewed onetime passcodes as the most secure sign-in method was the UK, not India; of participants in India, 25 percent viewed such passcodes as the most secure method.

Q2

A

- A. “When I create playlists or choose songs to listen to, I often pick songs that I think the friends who are following me might be interested in listening to, rather than what I might actually prefer listening to in that moment.”
- 

Choice A is the best answer because it directly reflects both aspects of Walsh’s finding about the social media dimensions of music streaming platforms: that they make their users more mindful of how their listening activities may be perceived and that self-awareness then influences how users manage those activities. The quotation illustrates this by showing that the user considers the music preferences of their followers when selecting music (“songs that I think the friends who are following me might be interested in”), even if those choices differ from their own preferences (“rather than what I might actually prefer listening to in that moment”). This supports both aspects of Walsh’s finding: users have increased social awareness and deliberately change their listening habits based on that awareness.

Choice B is incorrect because it focuses on how the platform’s algorithmic recommendation system influences user choice, not on how the imagined opinions of other users might influence that choice. The quotation highlights a user’s concern about repetitive music recommendations based on their past listening behavior. It does not suggest that the user is adjusting their listening habits based on how they think others may perceive what they listen to. Choice C is incorrect because it focuses on the social connection that can be created by music streaming rather than illustrating how social awareness affects users’ management of their listening activities. While this quotation addresses the social dimensions of streaming platforms, it describes how these features create shared experiences rather than demonstrating how concern about others’ perceptions influences users’ listening choices. Choice D is incorrect because it compares streaming platforms to traditional music purchasing methods. This comparison doesn’t address the social media dimensions of streaming platforms or how awareness of others’ perceptions of music selections influences what users choose to listen to.

---

Q3

C

- C. More midges were found in the trap that only played calls than in the trap that played calls and released carbon dioxide.
- 

Choice C is the best answer because it presents a finding that, if true, would most directly support the researchers' conclusion that carbon dioxide does not serve as an additional cue to frog-biting midges regarding the location of male túngara frogs. The text begins by stating that the mating call of the male túngara frogs also attracts frog-biting midges, which prey on the frogs' blood. Researchers Bernal and de Silva were curious if the mating calls were sufficient signals for the midges to locate the frogs or if midges also used carbon dioxide emitted by the frogs to locate their prey. The text then details the procedure the researchers used to investigate their question and summarizes their conclusion—that carbon dioxide does not serve as an additional cue to the midges. Thus, if more midges were found in the researchers' trap that only played calls than in the trap that played calls and released carbon dioxide, it follows that the frog calls seem sufficient without the carbon dioxide cue. This finding supports the researchers' conclusion that carbon dioxide does not serve as an additional cue to frog-biting midges.

Choice A is incorrect because finding that the majority of frog-biting midges were found in the traps that both played the mating call and released carbon dioxide would present evidence that directly refutes the researchers' conclusion—that carbon dioxide does not serve as an additional cue to the frog-biting midges regarding the location of túngara frogs. Choice B is incorrect because if the midges entered the trap that played calls and released carbon dioxide only during or immediately after carbon dioxide was released, that would suggest that the midges used the carbon dioxide as a way to locate their prey, a finding that would contradict the researchers' conclusion that carbon dioxide was not an additional cue to the midges. Choice D is incorrect because a trap attracting larger numbers of midges with high carbon dioxide concentrations than a trap with low carbon dioxide concentrations suggests that carbon dioxide might serve as an additional cue to the midges as to the location on the frogs, a finding contrary to the researchers' conclusion.

---

## Q4

A

- A. the percentage of 2016 cookbook sales that were e-books with the percentage of 2016 science fiction and fantasy sales that were e-books.
- 

Choice A is the best answer because it uses data from the table to effectively support the claim that book genres that typically require the reader to start at the beginning of the story and read straight through are more commercially successful as e-books than other genres. For each of three years, the table presents four book genres and the percentage of total sales for each genre in e-book format. Cookbooks, a nonfiction genre, do not require the reader to read straight through. According to the table, 10.5 percent of total cookbook sales in 2016 were in the e-book format. The 2016 percentage of e-book sales was 36.7 percent in the science fiction and fantasy genre, which are typically stories read straight through from start to finish. The higher percentage of total sales of the story-based e-books in 2016 supports the claim in the text.

Choice B is incorrect because it compares the e-book sales of romance books in 2006 to those in 2016. Romance books are meant to be read straight through from start to finish. The text claims that books that are not stories and do not require reading straight through are not as commercially successful in e-book format as those that do. As this choice is only comparing e-book sales for one genre, it does not support the claim. Choice C is incorrect because both science fiction and fantasy and romance novels are fiction books meant to be read straight through from beginning to end. The text claims that books that are not stories and do not require reading straight through are less commercially successful in e-book format than those that do. As this choice does not compare e-book sales of story genres to e-book sales in genres that are not stories, it does not support the claim. Choice D is incorrect. Although the data in the table show that the travel guide e-books made up a greater percentage of total sales in 2016 than in 2011, this doesn't illustrate the claim in the text that e-books in nonfiction genres not meant to be read straight through are less commercially successful. The claim cannot be supported without comparing the percentage of e-book sales between fiction and nonfiction book genres from the table.

---

**Q5**

**A**

- A. The LINE transposon in *O. vulgaris* and *O. bimaculoides* genomes is active in an octopus brain structure that functions similarly to the human hippocampus.
- 

Choice A is the best answer. The text says that LINE transposons are important in the human hippocampus, which supports complex cognition. If the LINE transposon found in octopuses is active in a similar part of their brain, that would suggest that LINE transposons support complex cognition in octopuses too, which in turn supports the hypothesis that LINE transposons are linked to advanced cognition in general.

Choice B is incorrect. This choice doesn't support the hypothesis. It doesn't include anything about how LINE transposons function in species other than humans. Choice C is incorrect. This choice doesn't support the hypothesis. It doesn't include anything about how the LINE transposon in octopuses might support advanced cognition. Choice D is incorrect. This choice doesn't support the hypothesis. It doesn't include anything about how the LINE transposon in octopuses might support advanced cognition.

**Q6**

**D**

- D. “Through interbreeding, transgenic fish might introduce the trait of fluorescence into wild fish populations, making those populations more vulnerable to predators.”
- 

Choice D is the best answer because this quotation would best support the student’s assertion that the escape of transgenic fish from Brazilian fish farms into the wild may have significant negative long-term ecological effects. The text explains that transgenic fish have DNA that includes genetic material from other species, that some transgenic fish have genes from jellyfish that make them glow in the dark, and that glow-in-the-dark transgenic fish can now be found in the wild in Brazilian creeks. The quotation indicates why the escape of these fish may have negative long-term ecological effects: glow-in-the-dark transgenic fish might introduce fluorescence into wild fish populations by breeding with wild fish, causing wild fish to glow in the dark and thereby allowing predators to prey on them much more easily.

Choice A is incorrect because this quotation doesn’t mention any negative effects of the introduction of fluorescent transgenic fish into the wild. The quotation merely compares the ratio of females to males at two sites in the wild where transgenic fish have been observed.

Choice B is incorrect because this quotation doesn’t support the idea that the escape of fluorescent transgenic fish from Brazilian fish farms may have significant negative long-term ecological effects. Rather, the quotation suggests that more research is needed to understand the effects. Choice C is incorrect because this quotation supports the idea that transgenic fish may be present in more ecosystems than has been observed; it doesn’t address whether the presence of fluorescent transgenic fish affects these ecosystems.

---

**Q7**

**D**

D. around 40% urban in 1970 to more than 70% urban in 2020.

---

Choice D is the best answer. This choice effectively uses data from the graph to complete the example. The line representing the percent of Algeria's population living in cities is the black triangle line. According to the graph, it started at 40% in 1970 and reached 70% in 2020.

Choice A is incorrect. This choice misreads the graph. The line representing the percent of Algeria's population living in cities is the black triangle line. According to the graph, it started at 40% in 1970 and reached 70% in 2020. Choice B is incorrect. This choice misreads the graph. The line representing the percent of Algeria's population living in cities is the black triangle line. According to the graph, it started at 40% in 1970 and reached 70% in 2020. Choice C is incorrect. This choice misreads the graph. The line representing the percent of Algeria's population living in cities is the black triangle line. According to the graph, it started at 40% in 1970 and reached 70% in 2020.

---

Q8

B

- B. The spider population count also substantially declined by day 30 in the enclosure without lizards.

---

Choice B is the best answer because it describes data from the graph that weaken the student's conclusion about the reduction in the spider population in the enclosure with lizards. The graph shows that the enclosure with lizards and the enclosure without lizards each began with about 85 spiders, and that the number of spiders in each enclosure fell over the 30 days of the study. The student's claim is that the reduction in spiders in the enclosure with lizards is "entirely attributable to the presence of the lizards," meaning that the spider population wouldn't have declined except for the presence of the lizards. This claim is weakened, however, by the fact that the enclosure without lizards also saw a substantial reduction in the number of spiders. Since the number of spiders fell in the enclosure without lizards as well as in the enclosure with lizards, there must be some other factor than just the presence of the lizards that contributed to the reduction in the spider population.

Choice A is incorrect because the fact that the two enclosures started with the same number of spiders is irrelevant to the claim that the reduction in spider population by day 30 in the enclosure with lizards can be entirely attributed to the lizards. Choice C is incorrect because the fact that the spider population in the enclosure with lizards fell more between days 1 and 10 than in other periods has nothing to do with the student's claim that the reduction in spiders in that enclosure by day 30 can be entirely attributed to the lizards. Choice D is incorrect. Although it's true that on day 30 the spider population was lower in the enclosure with lizards than in the enclosure without lizards, this fact doesn't weaken the student's claim that the reduction in the spider population in the enclosure with lizards can be entirely attributed to the lizards. Indeed, the lower spider population in the enclosure with lizards suggests that the lizards are contributing to the reduction in the spider population, though the fact that the spider population also fell substantially in the other enclosure means that the lizards aren't the only cause of the reduction.

---

Q9

A

- A. The soil surrounding healthy plants contained significantly higher concentrations of microbes known to inhibit *Ralstonia solanacearum* than the soil surrounding diseased plants did.
- 

Choice A is the best answer. This choice provides evidence that directly links the presence of *R. solanacearum*-inhibiting microbes in the soil to the health of tomato plants.

Choice B is incorrect. This choice would weaken the team's conclusion. It suggests that the presence of the disease-causing bacteria had no effect on the health of the tomato plants.

Choice C is incorrect. This choice doesn't support the team's conclusion. The conclusion is about microbes, not soil moisture. Choice D is incorrect. This choice would weaken the team's conclusion. It suggests that the presence of the bacteria-inhibiting microbe in soil had no effect on the health of the tomato plants.

---

Q10

B

- B. Compared with participants who saw the control review, participants who saw the low-anger review rated the review as slightly more helpful, whereas participants who saw the high-anger review rated the review as less helpful.
- 

Choice B is the best answer. The claim is that low anger does not negatively affect readers' perceptions of the review, while high anger does negatively affect readers' perceptions of the review. This choice accurately expresses the supporting data from the "helpfulness of review" part of the graph: that low-anger reviews were rated as slightly more helpful than no-anger reviews, while high-anger reviews were rated as less helpful than no-anger reviews.

Choice A is incorrect. This choice does not support the conclusion. The conclusion is only about how participants feel about the review itself—the participants' ratings of the reviewed product are not relevant. Choice C is incorrect. This choice does not support the conclusion. The conclusion is only about how participants feel about the review itself—the participants' attitude towards the reviewed product is not relevant. Choice D is incorrect. This choice does not support the conclusion. The conclusion is only about how participants feel about the review itself—the participants' attitude towards the reviewed product is not relevant.

---

## Notes

Accept equivalent forms (e.g.  $0.25 \equiv 1/4$ ). For grid-in items, decimal and fraction answers are both valid.
