7 answers · Rationale-rich · Teach from doc

Q1**A**

- A. The newspaper published approximately 1,000 investigative articles in 2010 and approximately 500 in 2019.

Choice A is the best answer. By comparing the number of investigative articles in 2010 to the number in 2019, we can see that the number has fallen overall.

Choice B is incorrect. This choice misreads the graph. The 1,600 articles published in 2013 was the largest annual number of investigative articles published during the period. Also, notice that the claim focuses on an overall change, while this choice just focuses on one year. We can't determine an overall increase or decrease by looking at just one year. Choice C is incorrect. The 1,000 articles published in 2017 wasn't the largest number published during the period. Also, notice that the claim focuses on an overall change, while this choice just focuses on one year. We can't determine an overall increase or decrease by looking at just one year. Choice D is incorrect. This choice doesn't justify the claim. The claim is about a decrease in articles published between 2010 and 2019. This data shows an increase in articles published over a different period (2010-2013).

Q2**D**

- D. People would often give their copies of *Gidra* to others once they had finished reading an issue.

Choice D is the best answer. If there were more *Gidra* readers than there were copies of the newsletter, then the newsletter's influence would be much greater than its 4,000 monthly copies.

Choice A is incorrect. Information about the newsletter's initial funding doesn't tell us about the influence that the newsletter eventually had. Choice B is incorrect. While the content of *Gidra* was undoubtedly related to the newsletter's influence, this information isn't relevant to the specific hypothesis about monthly circulation numbers. Choice C is incorrect. Where the publishers of *Gidra* were initially based doesn't tell us about the newsletter's overall influence.

Q3

A

- A. the number of cars produced increased but the number of companies producing cars decreased.
-

Choice A is the best answer because it most effectively uses data from the table to complete the statement about the US auto industry in the early twentieth century. The table shows the number of cars produced annually and number of companies producing cars in the United States between 1910 and 1925 in increments of five years. According to the table, the number of cars produced consistently increased from one increment to the next, going from 123,990 cars in 1910 to 3,185,881 cars in 1925. At the same time, the table shows that the number of companies producing cars consistently decreased, going from 320 companies in 1910 to only 80 companies in 1925. Thus, the table shows that the number of cars produced increased from 1910 to 1925, even as the number of companies producing cars decreased.

Choice B is incorrect. The table shows that the number of cars produced in the US increased, going from 123,990 in 1910 to 3,185,881 in 1925, instead of remaining unchanged, and the table also shows that the number of companies producing cars decreased from 320 to 80 instead of remaining unchanged. Choice C is incorrect because the table indicates that the number of cars produced consistently increased from 1910 to 1925, going from 123,990 cars to 3,185,881 cars, instead of decreasing; moreover, the table shows that the number of companies producing cars from 1910 to 1925 declined from 320 to 80 instead of remaining unchanged. Choice D is incorrect because the table indicates that the number of companies producing cars consistently decreased from 1910 to 1925, going from 320 companies to only 80 companies.

Q4

D

D. 39.21 square miles.

Choice D is the best answer because it most effectively uses data from the table to support the statement about the tribal nation of Los Coyotes Band of Cahuilla and Cupeño Indians in California. The text states that most tribal nations in California are less than 50 square miles in total area and provides Los Coyotes Band of Cahuilla and Cupeño Indians as an example. According to the table, the tribal nation of Los Coyotes Band of Cahuilla and Cupeño Indians covers 39.21 square miles in Southern California, which is less than 50 square miles.

Choice A is incorrect because it cites the area of La Jolla Band of Luiseño Indians (13.50 square miles), not that of Los Coyotes Band of Cahuilla and Cupeño Indians. Choice B is incorrect because it cites the area of the Agua Caliente Band of Cahuilla Indians (53.68 square miles), not that of Los Coyotes Band of Cahuilla and Cupeño Indians. Additionally, this area is greater than 50 square miles and therefore wouldn't be an effective example for illustrating the text's statement that most tribal nations in California are less than 50 square miles in total area. Choice C is incorrect because it cites the area of the Pauma Band of Luiseño Mission Indians (9.36 square miles), not that of Los Coyotes Band of Cahuilla and Cupeño Indians.

Q5

D

D. "Although female pilots were typically expected to wear traditional but impractical attire that included dresses or skirts, photographs of Coleman show her wearing pants and leather jackets."

Choice D is the best answer. This choice supports the claim of Coleman's intentional defiance of social norms: female pilots were expected to wear skirts, but Coleman wore pants and leather jackets instead.

Choice A is incorrect. Coleman flew a well-known, common plane, which would not have defied social norms among pilots. Choice B is incorrect. Her complicated relationship with managers and staff would not have been a component of Coleman's public persona. This choice also fails to mention any "social norms of the time." Choice C is incorrect. While this quotation suggests that Coleman was careful and purposeful about her public image, it doesn't directly mention anything about "social norms of the time."

Q6

C

C. a shorter footprint, and a longer average stride.

Choice C is the best answer because it most effectively uses data from the table to complete the claim about the tracks left by two theropods. The table indicates that the set of tracks labeled La Torre 6A has an estimated footprint length of 32.8 centimeters, an average stride length of 5.23 meters, and an estimated mean speed of 6.5–10.3 meters per second. For the set of tracks labeled La Torre 6B, on the other hand, the estimated footprint length is 28.9 centimeters, the average stride length is 5.57 meters, and the estimated mean speed is 8.8–12.4 meters per second. Therefore, the theropod that left the La Torre 6B tracks had a shorter footprint and a longer average stride than the one that left the La Torre 6A tracks.

Choice A is incorrect. While it is true that of the two theropods, the one that left the La Torre 6B tracks had a longer average stride, it didn't have a longer footprint: the table shows that its estimated footprint length is 28.9 centimeters, while La Torre 6A's estimated footprint length is 32.8 centimeters. Choice B is incorrect because the table shows that of the two theropods, the one that left the La Torre 6B tracks had a footprint length estimated at 28.9 centimeters, which is shorter than the 32.8 centimeters estimated for the other set of tracks. Moreover, the theropod that left the La Torre 6B tracks had a longer average stride, not shorter: 5.57 meters, compared with 5.23 meters for the other set of tracks. Choice D is incorrect. While it is true that of the two theropods, the one that left the La Torre 6B tracks had a shorter footprint, it didn't have a shorter average stride: the table shows that its average stride length is 5.57 meters, while La Torre 6A's average stride length is 5.23 meters.

Q7

A

A. South West area.

Choice A is the best answer because it most effectively uses data from the table to complete the statement about the bike path survey. The table presents the percent of residents from five city areas who are in favor of adding more bike paths. With 88 percent of residents in favor of adding bike paths, the city's South West area has the highest level of demand.

Choice B is incorrect because, according to the data in the table, 33 percent of residents in the South Central area of the city are in favor of additional bike paths. The area of the city that has 88 percent of its surveyed residents in favor of additional bike paths will best complete the statement. Choice C is incorrect because, according to the data in the table, 12 percent of residents in the North East area of the city are in favor of additional bike paths. The area of the city that has 88 percent of its surveyed residents in favor of additional bike paths will best complete the statement. Choice D is incorrect because, according to the data in the table, 26 percent of residents in the North Central area of the city are in favor of additional bike paths. The area of the city that has 88 percent of its surveyed residents in favor of additional bike paths will best complete the statement.

Notes

Accept equivalent forms (e.g. $0.25 \equiv 1/4$). For grid-in items, decimal and fraction answers are both valid.
