Q1**D**

- D. It discusses the findings of a study that evaluated the effects of exposing a plant species to lunar soil conditions.
-

Choice D is the best answer. The text describes an experiment wherein space scientists compared plant growth in terrestrial and lunar soil conditions. It then discusses the findings of the study, including the fact that all the seeds germinated but that the plants grown in lunar soil exhibited signs of stress.

Choice A is incorrect. The text doesn't address this question, and never describes any specific characteristics of either soil. It merely describes the outcome of an experiment that exposed a plant species to lunar soil conditions. Choice B is incorrect. The text never compares methods of assessing indicators of stress—instead, it simply mentions several stress indicators observed in the study (red pigmentation, reduced leaf size, and inhibited growth rates). Choice C is incorrect. The text doesn't present any evidence that we could never achieve seed germination in lunar habitats, and in fact states that the seeds in the lunar soil did germinate.

Q2

D

D. It suggests that John longs to experience a larger life outside the Florida woods.

Choice D is the best answer because it accurately describes how the underlined sentence functions in the text as a whole. The text establishes that John has a strong imagination and then goes on to describe the St. John River near John's home in the Florida woods. The underlined sentence depicts John sending twigs sailing down the river while he imagines them reaching "Jacksonville, the sea, the wide world," where he wishes he could follow. This suggests that John longs to expand his life experiences beyond the Florida woods.

Choice A is incorrect because the second and third sentences of the text provide an extended description of the riverbank where John likes to go, whereas the underlined sentence describes what John does at that location. Choice B is incorrect because the first sentence of the text suggests that John's behavior "was puzzling" to others around him, whereas the underlined sentence concerns the content of John's imaginings. Choice C is incorrect because the underlined sentence elaborates on John's imagination but doesn't mention any other children to whom John could be compared.

Q3

D

D. It elaborates on an aspect of the maple trees that the women evaluate.

Choice D is the best answer because it best describes the function of the underlined sentence in the text's overall portrayal of how the women in Ohiyesa's tribe harvested maple syrup. The text states that the women used an axe to strike the maple trees in order to find out which ones would produce sap. The underlined sentence compares the trees to people, with the sap described as the trees' "life-blood." Some of the trees are ready to give out their sap, while others are unwilling to do so. Using personification, the sentence provides greater detail about the aspect of the maple trees—their potential to give sap—that the women are evaluating.

Choice A is incorrect because the personalities of the women are not discussed in the text. Although the underlined sentence does mention "individual characters," this reference is not to the women in the text but rather to the maple trees, which the sentence compares to people with individual character traits. Choice B is incorrect because the underlined sentence focuses on the trees' willingness or refusal to yield sap, not on the beneficial relationship between the women and the trees. Additionally, although the text does suggest that the women and their tribe benefit from the maple trees since the trees allow the women to harvest syrup, there is nothing in the text to suggest that the trees benefit from this relationship in turn. Choice C is incorrect because the underlined sentence is comparing maple trees to humans, not addressing the influence of the natural environment on how the actual humans in the text, the women, behave.

Q4

C

C. To convey the speaker's longing for the ocean to impart a sense of inner tranquility

Choice C is the best answer because it most accurately states the main purpose of the text, which is to convey the speaker's longing for the ocean to impart a sense of inner tranquility, or peace. The text begins by expressing the speaker's strong desire to be on the ocean, appealing directly to the waves to rock the speaker to sleep. The poem then describes the "slumberous lullaby" formed by the sound of the waves and the winds on which the speaker wishes to be carried "gently...between a peaceful sea and sky." All these details serve to emphasize the speaker's desire for the ocean to give them a sense of inner tranquility.

Choice A is incorrect. Given the poem's expression of a longing to achieve tranquility by drifting on the ocean, it can be inferred that the speaker desires to escape something unpleasant in daily life. However, the poem doesn't refer directly to any such hardship—ongoing or otherwise. And since the poem doesn't establish that the speaker is experiencing a desire to escape ongoing hardship, it can't be said that such a desire increases in intensity. Choice B is incorrect. The speaker does express a desire for the serenity of being rocked to sleep by the ocean, and it can be inferred that this desire is a response to demands that make the speaker's daily life stressful. However, the poem doesn't refer directly to such demands or contrast them with the tranquility of drifting on the ocean. Choice D is incorrect because the text doesn't suggest the speaker has any qualms, or reservations, about being transported by the ocean. On the contrary, the speaker actively desires to "drift far out" and be carried by the waves and wind. Moreover, the poem doesn't suggest that this drifting would have any particular destination.

Q5

C

C. To describe the silversword alliance and explain how the plant family became so varied

Choice C is the best answer because it most accurately describes the main purpose of the text, which is to describe the family of plants known as the silversword alliance and explain why the plants came to exhibit "an extraordinary range of phenotypes." The text introduces the silversword alliance as a family of plants unique to the Hawaiian Islands, presenting those that mature into vines and those that mature into shrubs and trees as examples of different phenotypes. The text concludes by explaining that these plants are all descendants of "a single ancestral tarweed plant" that arrived 5 million years ago in the Hawaiian Islands, where a "wide variety of habitats" drove the plant's descendants to adapt and thus differentiate themselves, diversifying into a group of related but distinct species with different physical characteristics.

Choice A is incorrect. Although the text explains why the plants within the silversword alliance have varied physical characteristics, the text doesn't suggest that tarweed is the ancestor of all plants on the Hawaiian Islands. The text states instead that all members of the silversword alliance descend from a single tarweed ancestor. Choice B is incorrect because while *Dubautia carrii* is mentioned as an example of a species in the silversword alliance, no details about its particular habitat are provided. And although the text indicates that the Hawaiian Islands are home to "a wide variety of habitats," it doesn't describe the specific habitat where *Dubautia carrii* is found. The text discusses the silversword alliance as a whole rather than focusing on *Dubautia carrii* or any one species within this family. Choice D is incorrect. Although the silversword alliance is only found on the Hawaiian Islands and includes "an extraordinary range of phenotypes," the text doesn't claim that all plants on the Hawaiian Islands are part of the alliance. Furthermore, the text indicates that these plants all "descended from a single ancestral tarweed plant," not that there are multiple possible candidates for that ancestor plant.

Q6

A

- A. It notes a factor that led Seira et al. to not dismiss risk-disclosure messaging altogether despite their evidence of its limited utility.
-

Choice A is the best answer because it most accurately describes the function of the underlined portion in the text as a whole. The text establishes that many countries have adopted risk-disclosure requirements for financial products due to concerns that consumers don't understand the risks associated with the products. According to the text, Seira et al. found that the effects of such messaging on consumer behavior were small and temporary. The text then adds that the researchers assert that because the cost of the messaging is negligible, the approach may be worth doing even if the effects are limited. Thus, the underlined portion notes a factor—very low cost—that led the researchers to not completely dismiss risk-disclosure messaging despite their evidence of its limited utility.

Choice B is incorrect because the underlined portion doesn't refer to a particular type of risk-disclosure messaging, whether Seira et al. considered it or not; the underlined portion simply indicates that the cost of the messaging (broadly) is very low, which makes the approach worth pursuing even if its effects are limited. Choice C is incorrect. Although the underlined portion does describe a consideration that led the researchers to recommend risk-disclosure messaging despite the messaging's small effects on consumer behavior, it directly states that the cost of such messaging is negligible, or very low—meaning that both the effects and the costs are small, not that the effects are small only relative to the costs. Choice D is incorrect because there's no indication that Seira et al. suggest that risk-disclosure messaging could be more effective if it had lower costs; rather, the underlined portion indicates that Seira et al. believe the already negligible cost of messaging makes the approach worth pursuing even if its effects are limited.

Q7

C

- C. It introduces a natural phenomenon, refutes two potential explanations for that phenomenon, and then presents a third explanation for that phenomenon that the author regards as plausible.
-

Choice C is the best answer because it most accurately describes the overall structure of the text. The text begins by introducing the natural phenomenon of intermittent mass loss with regard to Asteroid 6478 Gault and notes that it curiously has not lost mass at its perihelion like other asteroids typically do. The text then refutes "solar energy-driven ice vaporization" and "the singular nature of impact ejection" as two possible explanations for Asteroid 6478 Gault's intermittent mass loss. Finally, the text presents Luu et al.'s explanation that "6478 Gault is shedding mass due to rotational instability," which the author says is "likely correct." Thus, the overall structure of the text is that it introduces a natural phenomenon, refutes two potential explanations for that phenomenon, and then presents a third explanation for that phenomenon that the author regards as plausible.

Choice A is incorrect because the text doesn't distinguish between multiple observations. It focuses on the single observation that Asteroid 6478 Gault is losing mass and evaluates multiple explanations for the phenomenon. The text also asserts that Luu et al.'s explanation is credible and "likely correct." Choice B is incorrect because the text describes a natural phenomenon, not a specific astronomical finding. In addition, although the text does note flawed reasons for Asteroid 6478 Gault's intermittent mass loss, it doesn't mention that Asteroid 6478 Gault's intermittent mass loss is based on new evidence. Choice D is incorrect. Although the text does evaluate explanations for the cause of Asteroid 6478 Gault's intermittent mass loss, the text also asserts that Luu et al.'s explanation that they have put forth is persuasive and "likely correct."

Q8

B

- B. It presents a generalization that is exemplified by the discussion of the mimosa trees and *B. terrenus*.
-

Choice B is the best answer because it most accurately describes the function of the third sentence within the overall structure of the text. The third sentence makes a generalization, asserting that evolutionary links between predators and prey can persist across great expanses of time and distance. This generalization is exemplified by the text's discussion of the relationship between mimosa trees and *B. terrenus* beetles. When mimosa trees were introduced to North America in 1785, no *B. terrenus* beetles were present, so the relationship between the trees and the beetles that exists in their native East Asia was disrupted. When the beetles were introduced to North America more than 200 years later, however, they quickly attacked mimosa trees, illustrating the generalization that links between predators and prey "can persist across centuries and continents."

Choice A is incorrect because the third sentence doesn't indicate that Chang and colleagues were investigating any hypothesis. According to the text, Chang and colleagues were simply monitoring mimosa trees when the beetles happened to be introduced to the area. Choice C is incorrect because the third sentence doesn't discuss any particular species, let alone the species mentioned elsewhere in the text, nor does the sentence explain why species spread to new locations. Choice D is incorrect because the third sentence offers a generalization about the relationship between predators and prey, not an explanation for the findings by Chang and colleagues that's an "alternative" to an explanation presented elsewhere in the text.

Q9

C

- C. It summarizes a finding suggesting that some mechanisms in the brains of certain insects resemble mechanisms in mammalian brains.
-

Choice C is the best answer because it most accurately describes the main purpose of the text, which is to summarize a finding suggesting that some mechanisms in the brains of certain insects resemble mechanisms in mammalian brains. The text begins by explaining that feelings such as pleasure and displeasure are linked to chemical processes in the brain, such as the release of dopamine when one receives a reward. The text then indicates that such processes have been seen in mammals but that researchers have recently observed similar processes involving dopamine in honeybees. Taken together, this information serves to sum up the discovery that some mechanisms in the brains of certain insects may resemble mechanisms linked to feelings such as pleasure and displeasure in mammals.

Choice A is incorrect because the text doesn't describe any experiments or experimental methods. Instead, the text describes a phenomenon that has been observed in mammals and then presents the recent observations of Huang and colleagues that this phenomenon is also seen in honeybees. Choice B is incorrect because there's nothing in the text to suggest that certain insects can express how they're feeling through particular processes. The text does indicate that certain honeybee behaviors such as foraging are linked to dopamine, but it doesn't suggest that these behaviors enable honeybees to communicate feelings or sensations. Choice D is incorrect because the text presents research showing that certain honeybee behaviors such as foraging are linked to dopamine and therefore may be motivated by similar mechanisms to those in mammalian brains, not that honeybees and mammals behave similarly when there is the possibility of reward for their actions.

Q10

D

- D. To identify a comparable circumstance that helps justify LaBerge and team's conclusion
-

Choice D is the best answer because it most accurately describes how the underlined portion functions in the text as a whole. The text first establishes that in order to investigate visual perception of objects in dreams, LaBerge and team observed the eye movements of lucid dreamers (people who are aware of their dreaming as it occurs) when these participants signaled that they were in a dream state. The underlined portion then describes a finding that rests on a comparison: the way participants' eyes tracked objects in dream states was very similar to how sighted people track real objects when awake. Finally, the text states that the team concluded from this finding that objects in dreams are perceived as more than just products of imagination—implying that the team thinks the eye movements are an indication that the brain treats dream objects as more real than imaginary. Thus, the function of the underlined portion is to identify a circumstance that is comparable to one in the study and that helps justify LaBerge and team's conclusion, presenting the close similarity of visual tracking in wakeful and dreaming scenarios as support for the implicit idea that the brain perceives dream objects not as imaginary but as somewhat or fully real objects.

Choice A is incorrect because the text never presents LaBerge and team's initial hypothesis, only what question they were interested in studying and what they found. So although the underlined portion does present evidence, that evidence doesn't serve to undermine any hypothesis in the text. Choice B is incorrect because the text gives no indication that LaBerge and team changed the focus of their study at any point or that the finding described in the underlined portion (or any other finding) was unexpected or surprising. Choice C is incorrect. Rather than illustrating an implication of the main finding by LaBerge and team, the underlined portion only presents the finding itself, stating that the team found that the movements of lucid dreamers' eyes while dreaming were very similar to those of sighted people visually tracking objects while awake. The next part of the text indicates what the finding implied to the team but still doesn't offer a real-world example as illustration.

Notes
