Q1**D**

D. the fitness study can be done well without years of data collection.

Choice D is the best answer because it most logically completes the text's discussion of the costs of studies. The text indicates that HILDA is a longitudinal study—it involves repeated observations over a long time—and that the "need for years of data collection" is what causes it and most other longitudinal studies to have high costs. The text then contrasts such studies with more straightforward studies, using the example of a fitness study that wants only to find out how many regular exercisers in a particular location do weight training, that may not demand a large budget. The contrast emphasized in the text most directly suggests that the fitness study may cost less than a study like HILDA because the fitness study aims only to determine a current percentage and thus can be completed well without extending data collection over years.

Choice A is incorrect because the text explicitly introduces the idea of a less expensive, straightforward fitness study as a contrast to many longitudinal studies that, like HILDA, have high costs because they require data collection over many years. The fitness study is described as trying merely to gather information about a current behavior (how many regular exercisers do weight training) rather than track trends over time, which suggests that costs could remain low because expensive longitudinal methods would not be needed, not because they would be suitable. Choice B is incorrect because the idea that HILDA researchers could easily add questions to their study might be relevant to the costs of that survey but would be completely irrelevant as an explanation for why an unrelated fitness study may not need a large budget; the studies have no direct bearing on each other. Choice C is incorrect because the idea that HILDA involves more people than necessary would be relevant to the costs of that survey but would be completely irrelevant as an explanation for why an unrelated fitness study may not need a large budget; the studies have no direct bearing on each other.

Q2

A

- A. the practice used by ancestors of modern Kwakwaka'wakw people not only effectively maintained a food source but also promoted its robustness.
-

Choice A is the best answer because it most logically completes the text's discussion of the use of songs by the Kwakwaka'wakw people to record and communicate ecological knowledge. The text indicates that some songs of the Kwakwaka'wakw people of Canada's Pacific Northwest region document how the people used terraced gardens in intertidal zones to cultivate clams for food. The text also explains that archaeological evidence shows increases in "clam size and abundance" that occurred along with the implementation of this cultivation method, suggesting the method's efficacy in not just supporting clam yields but also improving them. It follows, then, that the use of intertidal terraced gardens, as described in the songs, allowed the ancestors of modern Kwakwaka'wakw people to maintain clams as a food source and to cultivate larger and more numerous clams.

Choice B is incorrect because the text doesn't mention anything about cultivation practices among non-Indigenous people in the Pacific Northwest coastal region. Though the text conveys that archaeological evidence suggests that the clam cultivation practice mentioned in Kwakwaka'wakw people's songs was efficacious when implemented, it gives no indication that people other than the Kwakwaka'wakw adopted that practice. Choice C is incorrect because the text provides no information about the archaeological record as it pertains to Sakha and Kaluli songs and doesn't suggest that there is less corroboration of practices described in those songs than there is of the clam cultivation practice described in Kwakwaka'wakw songs. The Sakha and Kaluli songs are mentioned early in the text only as examples of Indigenous songs that contain ecological knowledge. Choice D is incorrect because archaeological evidence that clam size and abundance both increased when Kwakwaka'wakw ancestors implemented intertidal terraced gardens provides information only about the past use of that method and doesn't suggest anything about present practices. The text indicates that knowledge of a past clam cultivation method is maintained in Kwakwaka'wakw songs but doesn't indicate whether modern Kwakwaka'wakw people use that or other fishing and farming practices used by their ancestors.

Q3

D

- D. correlations in a country between languages and regions where they are spoken can replicate themselves in a new country to which the original country's citizens emigrate.
-

Choice D is the best answer because it logically completes the text's discussion of patterns of linguistic distribution in New York City. The text explains how Chinese immigrants in New York City tend to settle in different boroughs based on their region of origin in China: those from north China (Mandarin speakers) typically settle in Queens, while those from south China (Cantonese or Fuzhounese speakers) typically settle in Manhattan. This pattern demonstrates that the regional language distribution in China (north versus south) has reproduced itself in New York City (Queens versus Manhattan). Therefore, it can be reasonably inferred that correlations between languages and regions in one country can replicate themselves when citizens of that country emigrate to a new country.

Choice A is incorrect because the text doesn't discuss rates of language change. The text indicates that many languages are spoken in New York City, but it doesn't provide any information about how quickly these languages might be changing, either in relation to each other or compared to areas where fewer languages are spoken. Choice B is incorrect because the text provides no information about changes in vocabulary or pronunciation of immigrant languages compared to their original forms. The text only discusses where different groups of language speakers tend to settle, not how their languages might have evolved after immigration. Choice C is incorrect because the text doesn't provide any information about a relationship between a country's physical size and the number of languages spoken there. While the text mentions that over 600 languages are spoken in New York City, it doesn't relate this to the physical size of New York or the United States, nor does it suggest that large countries like China have more languages than geographically smaller countries.

Q4

B

B. risk misrepresenting the full range of Zelda’s contributions to literature.

Choice B is the best answer because it most logically completes the text’s discussion of Zelda Fitzgerald’s contributions to literature. The text begins by saying that many scholars view Zelda mainly in terms of her marriage to F. Scott Fitzgerald and “don’t recognize Zelda as a writer in her own right.” The text then mentions a novel and “numerous short stories” that she wrote and that such scholars tend to ignore. Therefore, those scholars who focus on Zelda only as an inspiration for F. Scott’s writings risk misrepresenting the full range of Zelda’s contributions to literature.

Choice A is incorrect. Although the text does mention that Zelda Fitzgerald “likely influenced” her husband’s literary work, its focus is on Zelda’s own writing, not on her husband’s writing or factors that might have influenced it. Choice C is incorrect because the text does not discuss F. Scott and Zelda Fitzgerald’s opinions of each other’s works. Choice D is incorrect. Although the text does suggest that F. Scott Fitzgerald’s works were “likely influenced in part” by his marriage to Zelda, it does not discuss autobiographical interpretations of the works of either F. Scott or Zelda.

Q5

B

B. the Vinland Map could not have been drawn by mid-1400s mapmakers.

Choice B is the best answer because it most logically completes the text's discussion of Lemay, Zyats, and Bezur's 2021 analysis of the Vinland Map. The text indicates that while some scholars have believed that the map was drawn in the mid-1400s, the 2021 analysis showed the presence of the compound titanium dioxide in the ink used to draw the map. The text goes on to say that titanium dioxide wasn't used to manufacture ink until the early 1900s, which means that ink containing this compound couldn't have been available to mapmakers in the 1400s. Since mapmakers in the mid-1400s couldn't have used ink with titanium dioxide, it follows that the Vinland Map couldn't have been drawn by mid-1400s mapmakers.

Choice A is incorrect because the 2021 finding that the ink used to draw the Vinland Map wasn't available until the early 1900s doesn't imply that Europeans in the mid-1400s couldn't have known about the eastern coast of North America. While this finding suggests that the map couldn't have been created in the mid-1400s, it doesn't preclude the possibility that Europeans nevertheless had knowledge—and perhaps even drew other maps that are no longer in existence or are yet to be discovered by researchers—of the eastern coast of present-day North America as early as the mid-1400s. Choice C is incorrect because there's nothing in the text that suggests that the 2021 discovery of the presence of titanium dioxide in the ink used to draw the Vinland Map caused Lemay, Zyats, and Bezur to question or reach a new conclusion about when mapmakers began using ink containing titanium compounds. Instead, the text indicates that titanium dioxide wasn't used in ink before the early 1900s. This knowledge led the team to conclude that the map, which was drawn with ink containing titanium dioxide, couldn't have been created in the mid-1400s. Choice D is incorrect because although the text doesn't indicate that Lemay, Zyats, and Bezur established an exact date for the creation of the ink that was used to draw the Vinland Map, the text does say that titanium dioxide was introduced in ink manufacturing in the early 1900s. This fact provides enough information to determine that the ink that was used to draw the map was created no earlier than the early 1900s. This finding, in turn, led the team to conclude that the Vinland Map couldn't have been drawn in the mid-1400s.

Q6

A

- A. it can't be concluded that the impact that made the crater was connected to the beginning of the Younger Dryas.
-

Choice A is the best answer because it most logically completes the text's discussion of a crater's connection to the start of the Younger Dryas. According to the text, some scientists believe that a comet fragment hitting Earth caused the cooling of the Younger Dryas period to come about. The text then indicates that a team of scientists found a crater in Greenland, which some believe supports the theory of a comet fragment hitting Earth to initiate the Younger Dryas. However, the text also notes that the team was unable to determine the age of the crater. If the age of the crater can't be determined, then its connection to the Younger Dryas period of time can't be confirmed either. Thus, it can't be concluded that the impact that made the crater was connected to the beginning of the Younger Dryas.

Choice B is incorrect because though the text suggests that the age of the comet crater found by a team of scientists is uncertain, it doesn't address whether a comet fragment can make a crater as large as 19 miles wide. The text doesn't consider the size of comet fragments and how they relate to the size of craters they might make. Choice C is incorrect because the debate in the text centers on the age of the crater found, not the cause of the crater. The text doesn't indicate uncertainty about what caused the discovered crater. Choice D is incorrect because the text suggests that the age of the crater found by the team of scientists is uncertain, not that the dates of the Younger Dryas are uncertain or incorrect. The text states that "the Younger Dryas was a period of extreme cooling from 11,700 to 12,900 years ago" but doesn't indicate any debate about the timing of the period.

Q7

B

- B. the sound quality of Cremonese violins results in part from a method the craftspeople used to alter the wood.
-

Choice B is the best answer because it most logically completes the text's discussion of the sound quality of Cremonese and modern violins. The text states that violins made in Cremona in the sixteenth to eighteenth centuries sound superior to modern violins. It then indicates that some experts attribute the difference to different woods being used to make these violins, but both Cremonese and modern violins are made of the same woods (maple and spruce); thus this cannot account for the difference. The text then says that recent analysis suggests the wood in Cremonese violins was chemically treated by the craftspeople who made them, thereby providing an alternate explanation for the sound differences: the chemical alteration that is present in the Cremonese violins but absent from the modern ones.

Choice A is incorrect because the text does not discuss how the sound quality of Cremonese violins compares with the sound quality of other instruments made during the sixteenth to eighteenth centuries. Instead it focuses on how the sound of the Cremonese violins compares with that of modern violins. Choice C is incorrect. The text states that there are differences in sound quality between the Cremonese and modern violins, and that both types of violin are made with maple or spruce. Thus the type of wood alone does not determine a violin's sound quality. Furthermore, even if the type of wood alone could account for differences in sound quality, the text makes no mention of other woods, so there is no basis to judge how modern violins would sound if they were made using woods besides maple and spruce. Choice D is incorrect because the text states that there is evidence that Cremonese craftspeople chemically treated the wood used in Cremonese violins. This evidence is attributed to "new analysis," which strongly suggests that this process was unknown to modern violin makers before that analysis. If the chemical treatment was unknown until recently, the manufacturing process for modern violins must differ with respect to the previously unknown practice of chemically treating the wood.

Q8

D

D. were able to store extra crops for later use.

Choice D is the best answer because it presents the conclusion that most logically completes the text's discussion of Sumerian civilization and crop growth. The text mentions the hot, sunny weather in the area where the Sumerians lived, which made crops grow quickly but also made it difficult to keep them alive. The Sumerians solved this problem by using river water for their farming—as a result, they often harvested more crops than were needed in a season. It follows that the Sumerians must have needed to find something to do with the surplus crops—that is, they stored the extra crops for later use.

Choice A is incorrect because it doesn't logically follow that a surplus in crops would lead the Sumerians to choose only certain days of the season to harvest. Nor is there any indication in the text that the Sumerians improved their farming methods with the goal of reducing the time spent farming. Choice B is incorrect because the text doesn't suggest that the Sumerians tried to shield their crops from the sun: in fact, the text indicates that the sunny weather helped crops grow very quickly and that the Sumerians used river water to allow crops to be exposed to the sun without dying. Choice C is incorrect. Having a surplus of crops wouldn't have caused the Sumerians to begin farming until long after 4000 BCE: in fact, since the text indicates that the Sumerian civilization formed around 4000 BCE and farming was a part of that civilization, the statement that Sumerians only began farming long after 4000 BCE isn't supported by the text.

Q9

B

B. is more relevant to contemporary audiences than it may seem at first.

Choice B is the best answer because it most logically completes the text's discussion of Ana Castillo's 1986 novel *The Mixquiahuala Letters*. The text states that the novel consists entirely of letters from the narrator to her friend—a format that some students reading the novel in a class found intimidating. According to the text, those students also found the novel's treatment of gender to be old-fashioned. In response to the students' concerns, their professor emphasized the novel's relevance: it's written in modern-sounding language and addresses issues that still matter. This, in turn, suggests that *The Mixquiahuala Letters* is more relevant to contemporary audiences than it may initially seem.

Choice A is incorrect because the professor's response to the students only mentions *The Mixquiahuala Letters*: it doesn't compare the novel to others from the same period. Choice C is incorrect because nothing in the professor's response to the students compares *The Mixquiahuala Letters* to contemporary novels about friendship. Choice D is incorrect because the professor's response to the students doesn't address the idea of reading the novel's letters multiple times and in different orders.

Q10

C

C. geographical isolation can influence how a language develops.

Choice C is the best answer because it is the choice that most logically completes the text. The text mentions a dialect of Spanish spoken in New Mexico, which was colonized by Spain in the 1600s. The text then states that the New Mexican dialect differs greatly from other Spanish dialects in that it still has characteristics of an older Spanish that other dialects eventually lost. After asking why this might be, the text points out that the New Mexico colony was distant from Spain's other colonies, making it less attractive to colonists after the initial colonization. This geographic isolation limited the colony's exposure to other Spanish colonists who would have otherwise introduced the changes to the Spanish language that occurred in their respective colonies. It can therefore be inferred that this isolation is a reason why the New Mexican dialect still has characteristics of an older Spanish, while the Spanish dialects spoken in less isolated areas that have more interaction with speakers of other dialects would lose those characteristics over time. Thus, the most logical completion of the text is that geographical isolation can influence how a language develops.

Choice A is incorrect because the text discusses different dialects of Spanish, not different languages altogether. Choice B is incorrect because the text focuses on how the New Mexican dialect has stayed the same over time in some ways, not on how it has changed from one generation to the next. Choice D is incorrect because though the text discusses how the New Mexican dialect of Spanish is different from others, it does not discuss how speakers of different dialects are able to understand each other.
