Q1

CRAFT AND STRUCTURE

In the late 1800s, Spanish-language newspapers flourished in cities across Texas. San Antonio alone produced eleven newspapers in Spanish between 1890 and 1900. But El Paso surpassed all other cities in the state. This city produced twenty-two newspapers in Spanish during that period. El Paso is located on the border with Mexico and has always had a large population of Spanish speakers. Thus, it is unsurprising that this city became such a rich site for Spanish-language journalism.

Which choice best states the main purpose of the text?

- A. To compare Spanish-language newspapers published in Texas today with ones published there during the late 1800s
- B. To explain that Spanish-language newspapers thrived in Texas and especially in El Paso during the late 1800s
- C. To argue that Spanish-language newspapers published in El Paso influenced the ones published in San Antonio during the late 1800s
- D. To explain why Spanish-language newspapers published in Texas were so popular in Mexico during the late 1800s

A team of researchers discovered that Matabele ants can identify an infected wound in a member of the colony and then treat the infection by covering the wound with antimicrobial secretions that the ants produce. The team found that the mortality rate for Matabele ants with infected injuries was reduced by 90% with this treatment, and they are hopeful that this discovery could aid in the development of new antibiotics for human use.

Which choice best describes the overall structure of the text?

- A. It summarizes research findings on Matabele ants and then identifies an area for further research.
- B. It introduces a study of Matabele ants and then explains the research methods used in the study.
- C. It describes unique properties of Matabele ants and then speculates on how those properties evolved.
- D. It identifies an issue concerning Matabele ants and then proposes a solution to address the issue.

Generally it takes Tule geese about four days to migrate south for the winter. From their summer breeding grounds in Cook Inlet, Alaska, the birds begin by flying over the Gulf of Alaska, keeping about 100 miles from the Canadian shore. They pause to rest on the Pacific Ocean, then fly toward Summer Lake, Oregon, before finally arriving at their winter destination of Sacramento Valley, California. In 2020, however, it took the geese over twice as long to make their way from Cook Inlet to Sacramento Valley. According to researchers, the reason was airborne pollutants.

Which choice best states the function of the underlined portion in the text as a whole?

- A. It illustrates a change in Tule geese’s usual flight behavior.
- B. It suggests an explanation for why Tule geese breed in Alaska.
- C. It describes part of the Tule geese’s typical winter migration journey.
- D. It compares Tule geese to other birds that migrate south for the winter.

Yawn contagion occurs when one individual yawns in response to another's yawn. Studies of this behavior in primates have focused on populations in captivity, but biologist Elisabetta Palagi and her colleagues have shown that it can occur in wild primate populations as well. In their study, which focused on a wild population of gelada monkeys (*Theropithecus gelada*) in Ethiopia, the researchers further reported that yawn contagion most commonly occurred in males and across different social groups instead of within a single social group.

Which choice best describes the function of the first sentence in the text as a whole?

- A. It defines a phenomenon that is discussed in the text.
- B. It introduces a problem that is examined in the text.
- C. It makes a claim that is challenged in the text.
- D. It presents a hypothesis that is evaluated in the text.

The following text is from Herman Melville's 1854 novel *The Lightning-rod Man*.

The stranger still stood in the exact middle of the cottage, where he had first planted himself. His singularity impelled a closer scrutiny. A lean, gloomy figure. Hair dark and lank, mattedly streaked over his brow. His sunken pitfalls of eyes were ringed by indigo halos, and played with an innocuous sort of lightning: the gleam without the bolt. The whole man was dripping. He stood in a puddle on the bare oak floor: his strange walking-stick vertically resting at his side.

Which choice best states the function of the underlined sentence in the overall structure of the text?

- A. It elaborates on the previous sentence's description of the character.
- B. It introduces the setting that is described in the sentences that follow.
- C. It establishes a contrast with the description in the previous sentence.
- D. It sets up the character description presented in the sentences that follow.

On painter William H. Johnson’s return to the United States in 1938 after a decade in Europe, his style underwent an abrupt transformation. Turning away from landscapes painted in an expressionist style—a style that often involves using fluid, distorted shapes and thick, textured brushstrokes to express the artist’s subjective experience of reality—Johnson began painting portraits of Black Americans in a bold new way. Evocative of African sculpture and American and Scandinavian folk art, these portraits feature flat, deliberately oversimplified figures in a vibrant but limited color palette.

Which choice best describes the function of the underlined sentence in the text as a whole?

- A. It elaborates on the previous sentence’s statement about a transitional moment in Johnson’s artistic career.
- B. It provides information about Johnson’s travels in support of a claim about his artistic influences, which is advanced in the following sentence.
- C. It recounts a moment in Johnson’s personal life that enabled the success of his subsequent career, which is summarized in the following sentence.
- D. It presents evidence that calls into question the previous sentence’s characterization of Johnson’s artistic development.

The north celestial pole (NCP)—the fixed point around which stars in the Northern Hemisphere (including the Sun) appear to rotate—is discernible only at night. Inspired by the navigational strategies of some insects and birds, researchers devised a method for locating the NCP in daytime using skylight polarization, which occurs as atmospheric particles scatter sunlight. A polarimetric camera captures images of polarization patterns, which rotate as the Sun’s position in the sky changes; temporal variances across images can then be used to determine an observer’s latitude and bearing relative to the NCP.

Which choice best describes the overall structure of the text?

- A. It illustrates how most navigational tools utilize the NCP, recounts how researchers discovered that certain animals are able to navigate without using the NCP, and then proposes that this discovery could be used to avoid problems in navigation associated with reliance on the NCP.
- B. It presents a celestial-based method of navigation, enumerates the comparative benefits of an alternative method used by certain animals that is based on an unrelated natural occurrence, and then indicates how researchers assessed the relative accuracy of the two methods.
- C. It explains how the NCP is typically located, emphasizes a key difference between how humans and certain animals use the NCP for navigation, and then suggests an alternative way of using the NCP to improve existing navigational instruments.
- D. It notes an obstacle to observing an astronomical phenomenon, mentions a navigational ability of certain animals that inspired a solution to that obstacle, and then explains how researchers used an optical device to mimic that ability.

When ancient oak planks were unearthed during subway construction in Rome, Mauro Bernabei and his team examined the growth rings in the wood to determine where these planks came from. By comparing the growth rings on the planks to records of similar rings in oaks from Europe, the team could trace the wood to the Jura region of France, hundreds of kilometers from Rome. Because timber could only have been transported from distant Jura to Rome by boat, the team's findings suggest the complexity of Roman trade routes.

Which choice best describes the function of the underlined sentence in the text as a whole?

- A. It presents a conclusion about Roman trade routes based on the team's findings.
- B. It questions how the team was able to conclude that the planks were used to build a boat.
- C. It explains why the planks were made from oak rather than a different kind of wood.
- D. It describes common methods used in Roman subway construction.

Industrial activity is often assumed to be a threat to wildlife, but that isn't always so. Consider the silver-studded blue butterfly (*Plebejus argus*): as forest growth has reduced grasslands in northern Germany, many of these butterflies have left meadow habitats and are now thriving in active limestone quarries. In a survey of multiple active quarries and patches of maintained grassland, an ecologist found silver-studded blue butterflies in 100% of the quarries but only 57% of the grassland patches. Moreover, butterfly populations in the quarries were four times larger than those in the meadows.

Which choice best describes the function of the underlined portion in the text as a whole?

- A. It challenges a common assumption about the species under investigation in the research referred to in the text.
- B. It introduces discussion of a specific example that supports the general claim made in the previous sentence.
- C. It suggests that a certain species should be included in additional studies like the one mentioned later in the text.
- D. It provides a definition for an unfamiliar term that is central to the main argument in the text.

Very little is known about the role nocturnal insects, such as moths, play in flower pollination because it is difficult to monitor insects at night. To address this problem, a team of scientists used time-lapse cameras to record pollinator visits to red clover all day and night. The recordings showed that while most pollinator visits were by bumblebees, one-third of visits were by moths. Additionally, flowers that were visited by both moths and bees produced more seeds than flowers that were only visited by bees.

Which choice best states the function of the underlined sentence?

- A. To describe an approach a team of scientists used to study pollinators
- B. To question a claim scientists make about pollinators
- C. To explain why moths prefer red clover to other flowers
- D. To announce an unexpected research finding about red clover
